

# Pediatric National Fatality Review-Case Reporting System (NFR-CRS) Tips and Tricks for FIMR Data Entry

*Question numbers below refer to Version 6.2 of the Pediatric NFR-CRS*

## **Logging In and Out**

Logging in: You must second-factor authenticate every day to use the NFR-CRS. The options are text message or email. Authenticating by text message (if you can) is quicker than email.

Logging out: When doing data entry, please click "Save and Exit" before logging out of the NFR-CRS. If you click "Logout" or click on the "X" in the top right-hand corner of your browser while in a case, data will not have been saved for that section.

## **Data Entry Tips by Section**

### **Case Definition**

Case Review Year: Refers to the calendar year in which the team reviewed the death. This field always defaults to the current calendar year when the case was first created; however, you can change the default value. This is generally an issue from January to March, when you may be entering deaths that were reviewed in the previous calendar year.

Case Type: FIMR users have three options: Death (live born infant who dies before reaching first birthday), Near Death/Serious injury, and Not born alive (Fetal/stillborn). It is important to select the correct case type. For fetal deaths, questions will be automatically skipped if they do not pertain to a stillbirth or an infant not born alive.

Never Left Hospital (NLH) following Birth Checkbox: This checkbox is used for hiding questions/sections that are not relevant to the child. For example, Section D – Supervisor will not display if the NLH checkbox is checked. If the case is a fetal/stillbirth death, then NLH automatically gets checked. The intention of this checkbox is to save time on data entry. It is not intended to be used for analytical purposes.

### **Section A. Child Information**

A15: If the child's health insurance was Medicaid, select "Medicaid" and not "State Plan."

A17: You do not need to know actual family income to answer this question. Use your best judgment based on information you have (e.g., caregiver's education, social service enrollment, health insurance) and your knowledge of the community.

A18: If a newborn infant died during the birth hospitalization, residence is the primary caregiver's residence.

A23: Please answer "Yes" to this question even if the family had only unsubstantiated referrals.

A24: Please answer "Yes" to this question only if a child protective case initiated prior to the incident causing the child's death was open at the time of death and incident.

A47: The response to this question populates the table in question A87 where previous pregnancies and pregnancy outcomes are documented. A47 includes the index pregnancy and A87 will populate the number in A47 minus one, because A87 only includes previous pregnancies.

A55: A "Yes" response can be selected for both fetal deaths (stillbirths) and infant deaths (based on history of the mother and laboratory testing).

A59: Please answer "Yes" if the mother had contact with a care provider within the first 3 weeks following birth. The "Yes" answer applies to either in-person or virtual visits. If a postpartum visit was completed at 6 weeks, you may document it in section O2 (FIMR Issues) section 1, Pre-/inter-/post-conception care, Postpartum Visit kept.

A107: Please answer "Yes" only if the mother died as a result of a pregnancy-related condition. Pregnancy-related conditions are those conditions caused by or exacerbated by the pregnancy itself (e.g., mother died of a postpartum hemorrhage).

A108: Please answer "Yes" if the mother died within one year of the pregnancy, regardless of the cause. Unlike pregnancy-related deaths (A107), this category can include injuries, homicide, and suicide. If you responded "Yes" to question A107, you do not need to respond "Yes" to question A108.

## **Section D. Supervisor Information**

D1: Children are considered supervised during the night if the supervisor was asleep at the time of the incident and the incident occurred when you would expect the family to be sleeping. Infants are considered supervised even if the caregiver was sleeping or impaired by illness, distractions, absence, or drug or alcohol use. See the Data Dictionary for more information about supervision.

D4: For medical conditions, if the child was an inpatient at a hospital at the time of death, the supervisor would be the hospital staff. For all others, list who was in charge of watching the child at the time of the incident leading to death.

D16: To note supervisor distraction, select "Yes" to gatekeeper question (at time of incident was supervisor impaired) and then select "Distracted" in the follow up checkbox.

## **Section E. Incident Information**

E3: This question notes the place of incident and not where the child died. “Hospital” is often incorrectly noted here.

## Section F. Investigation Information

F1: There does not need to be a scene investigation to answer “Yes” to this question. There is a follow up question in F1 that asks if the death investigation was conducted at the place of incident.

F15: Please answer “Yes” if there was evidence of abuse or maltreatment. Evidence of abuse does not have to be limited to physical abuse – it may include neglect.

## Section G. Official Manner and Primary Cause of Death

G1: Please do not enter text, only ICD-10 codes (e.g., W75 or V94.4). If you do not have the ICD-10 code, leave blank.

G6: For SUID deaths, if the medical examiner declared manner and cause to be undetermined, select “Undetermined if injury or medical cause.”

## Section H. Detailed Information by Cause of Death

H7a: For a list of common substances consumed or ingested in poisoning events, see <https://ncfrp.org/wp-content/uploads/Poisoning-Labels.pdf>. It lists both generic and brand names of substances and identifies which major category (e.g., Prescription, Illicit, OTC) the substance should be reported in H7a. This list is also available in the NFR-CRS in Section H7 (top of the section) when doing data entry for poisoning cases. Several new substances were added in Version 6.0 of the NFR-CRS including benzodiazepines, antihistamines, marijuana/THC, and fentanyl analogs. If the mother consumed or ingested a product while pregnant that caused a fetal or infant death, select the substances and the method taken as “in utero.”

H7b: Select “Accidental overdose/acute intoxication” when substance(s) were taken as a result of recreational use or addition. In utero ingestion should also be noted with this response option if the team felt that the poisoning was the cause of death of the infant.

## Section I. Other Circumstances of Incident

I2t: You can upload one photo for sleep-related deaths. The photo must be JPG format and less than 6mb. Do not include any identifying information such as timestamps, caregiver faces, or tattoos (can be identifying) in the photo.

I5: Determination of abuse, neglect, poor supervision, or exposure to hazards can be hard for teams. See Data Dictionary for help. Infants who are placed to sleep in an unsafe sleep environment should be noted as “Exposure to hazards,” though the death may be categorized as neglect depending on the circumstances. See [https://ncfrp.org/wp-content/uploads/I5\\_Sleep-Related\\_SUID\\_Guidelines.pdf](https://ncfrp.org/wp-content/uploads/I5_Sleep-Related_SUID_Guidelines.pdf) for details.

Prenatal exposure to illicit drugs or alcohol that causes or contributes to the death of the child (e.g., child born prematurely due to prenatal drug exposure to methamphetamines) should also be noted as “Exposure to hazards.”

I7: The goal of this section is to identify risk factors. Therefore, if the stressor was present, it should be marked. It is not a requirement that the team have evidence that the child felt stressed by the circumstance(s), just that the circumstance/stressor was present. The National Center encourages teams to complete this section to the best of their ability. For further assistance, see <https://ncfrp.org/wp-content/uploads/Completing-the-Life-Stressors-Section.pdf>.

I8: Please complete this section for all deaths that occurred during the COVID-19 federal emergency declaration from March 13, 2020, to May 11, 2023.

## **Section J. Person Responsible (Other than the Decedent)**

J1: Many injury deaths have a person responsible. See the Data Dictionary for more guidance.

## **Section L. Findings Identified During the Review**

L1, L2, L3: Encourage your team to answer these questions. They are the heart of fatality review discussions.

## **Section O. Narrative**

O1: Do not enter any identifying information in this section. This includes the decedent's name, date of death, names of hospital, and names of medical providers. Summarize key details important to the circumstances that are not entirely captured in the other sections.

O2: This section is frequently used by FIMR teams as a tool for case deliberation and generation of discussion and recommendations.

## **Data Quality Review**

This section allows you to check for the completeness of some questions. It is a great starting place to improve data quality.

## **Other Tips**

Data Dictionary: Text is directly available when entering case information by hovering over the blue help icon associated with each question, which looks like this: 

Other, specify: Please only use the "other, specify" field when your response does not fit into a listed option. For example, for place of incident, if the incident occurred at the home of the child's grandmother, mark "relative's home" NOT "other, specify" and specify grandmother's home. The additional level of detail noted in "other, specify" text is not helpful and makes analysis of data more complicated. If the level of detail is critical to understanding the circumstances of death, use the narrative to document it, not the "other, specify" field. The Data Dictionary provides guidance on what to include in many response options.

Copy Case Function: Use the Copy Case function for entering deaths of more than one decedent in the same incident, for example, r multiple gestations or multiple siblings who die in the same

car crash or house fire. Available on Manage Cases – Action drop-down. A brief tutorial is also available on the Help page in the NFR-CRS.

Save: Click “Save” in long sections like Section A3 or I2 when doing data entry. Data is saved when you navigate from section to section but does not save on an individual question basis.

Upload File: To upload a Word document related to an individual case, go to Manage Cases – Action drop down.

Case Summary: A FIMR Case Summary is available on Manage Cases – Action dropdown menu. You will have the option to select which sections to include in this report.

Standardized Reports: Are available from the main navigation menu, and available to every user. There are 35 reports available, including reports specific to data quality (see report 33 and 34) and one that shows all the findings/recommendations from reviews (see report 30).

Deleted cases can be recovered: If you accidentally deleted a case, please contact your State/County Coordinator or the National Center for assistance. If you have a Case Number that is being reported as “existing,” but it’s not in your Manage Cases list, it is deleted. Contact your state administrator or the National Center about re-assigning Case Numbers that have been deleted.
